TcHmiClockSample

This is a sample project with a JS Code Behind file that shows how to display the current time in a Textblock on the HMI. The sample is divided into two parts:

- Server UTC Time: The Server Time is linked on the Textblock in Desktop.view. The Server Time is formatted with the ToDateTimeString function of TcHmi.
- Client Time: The Client Time is determined in the Code Behind file depending on the time zone of the client. It shows two timestamp formats.

Please notice: Since Release 5 the TcHmi provides a possibility to localize times depending on the time zone of the user. Please take a look in the Information system.

Please follow the comments in the sample.
