

TcHmiControlFactorySamples

This is a sample project that shows how to dynamically create controls with the ControlFactory-API. This sample is divided into two parts:

- Control generation on project layer: The code behind file shows how to create controls inside an HMI project and how to add event listeners dynamically to these controls. In addition, the control will be removed by another button.
- Control generation inside Framework Controls: The Framework Control shows how to use the ControlFactory inside a Framework Control. In this case the control is generated in the `__attach`-function of the Framework Control.

Please follow the comments in the sample.
