

TcHmiDialogHandling

This is a sample project that shows how to handle dialogs inside the TwinCAT HMI in version 1.10. The sample is divided into two parts:

- **Z-Index-Handling:** This shows how to use different Z-Indexes and an overlay to display a dialog. This does not require any scripting in JavaScript, only configuration in the Designer.
- **TopMostLayer:** This shows how to use the TopMostLayer-API to automatically display elements in the TopMostLayer of the HMI. Elements in the TopMostLayer are displayed with an overlay. The Eventgrid and Trendlinechart control use the TopMostLayer too. This code is handled in the Code Behind file.

Please follow the comments in the sample.
