

## **TcHmiKeyboardHandling**

This is a sample project with two JS functions that shows how to automatically display the TcHmiKeyboard control for all input elements (TcHmiTextbox, TcHmiDatagrid with input field and TcHmiCombobox with input active). Therefore one “onPressed” event is configured for the Desktop element. On this event, a JS function is called to check if the current device is not a mobile device and if not, the TcHmiKeyboard will be displayed. On mobile devices the default keyboard of the device is shown.

Please follow the comments in the sample.
