

TwinCAT License Request Generator

The TwinCAT License Request Generator has been developed especially for TwinCAT XAR and ADS installations in which we do not provide an Engineering environment and therefore no possibility to create licensing files. To further understand the TwinCAT 3 licensing mechanisms, please consult our Beckhoff Information System.

Create a license request file

To create a TwinCAT 3 license request file, simply perform the following steps:

- Start the “TwinCAT 3 License Request Generator”
- Select all needed licenses
- Enter a Purchase Order
- Click on “Save License Request”
- Select a folder where the license request file should be stored

The created license request file can now be send to the Beckhoff Activation Server by sending an E-Mail to tclicense@beckhoff.com . It is important that you select the same licenses as shown in your order confirmation. If you have already activated licenses for the same SystemID, these licenses are automatically restored as a license response file from our database and send back to the sender.

Activating a license response file

After you have received a license response file from our activation server, this response file needs to be activated. To do that, simply perform the following steps:

- Start the “TwinCAT 3 License Request Generator”
- Click on “Activate License Response”
- Click on “Open File” and select the license response file received from the activation server
- Click on “Activate”

The license response file gets activated and all licenses within are available after a TwinCAT restart.
